Project Title: Online Product Ordering and Inventory System

Prepared By: Kolisetti Gopi Chandu

Date: 20/12/2025

Project Summary

This project aims to transform the existing offline electronics store into a complete online ordering platform with automated inventory management. The store currently faces challenges such as manual stock tracking, limited customer reach, and lack of digital presence. By implementing an e-commerce system, customers will be able to browse electronics, place orders online, and receive home delivery. The automated inventory module will ensure accurate stock updates, low-stock alerts, and improved operational efficiency. This project will enhance customer convenience, expand market reach, and support long-term business growth.

Current problems

Operational Problems

- Manual stock tracking leading to inaccuracies.
- Difficulty identifying fast-moving and slow-moving items.
- No real-time visibility of available stock.
- Errors during billing or stock updates.

Customer Problems

- Customers must visit the store physically.
- No home delivery or online ordering option.
- Limited product visibility — customers can't compare or check availability online.

Business Problems

- Reduced revenue potential due to offline-only model.
- Competitive disadvantage in the digital market.
- Lack of data insights for decision-making (e.g., product trends, demand forecasting).

Proposed Solution

The online ordering and automated inventory management system will resolve multiple challenges faced by the electronics store:

- Eliminates manual stock tracking by implementing real-time automated inventory updates.
- Provides an online platform where customers can browse, compare, and order products.

- Offers home delivery and order tracking to improve customer convenience.
- Reduces operational errors and improves stock accuracy.
- Provides dashboards and reports to help with better decision-making.
- Expands customer reach beyond the physical store, increasing sales.

Resources Required

- Human Resources
 - BA, UX Designer, Developers, QA, PM, DB Admin
- Technical Resources
 - Hosting, database, development tools, payment gateway
- Financial Resources
 - Development cost, maintenance cost, subscription costs
- Operational Resources
 - Staff training
 - Accurate product & stock data

Organizational Change

- Staff must adopt digital workflows
- Training required for order and inventory management
- Shift from manual to automated stock updates
- Cultural shift towards e-commerce business model

Recover ROI

- Expected ROI / Payback Period: 6–12 months
Because electronics have high demand, high margins, and sell quickly online.

Identifying Stakeholders

Stakeholders are identified based on their involvement, influence, and impact on the project. The following techniques are used to identify stakeholders:

- Interviews with store owner, employees, and customers
- Process analysis to understand who interacts with sales and inventory
- Document analysis such as store structure, roles, and responsibilities
- RACI Matrix to define responsibilities

Key stakeholder groups include:

- **Internal:** Store owner, inventory manager, sales staff, delivery team
- **Project Team:** BA, developers, QA, PM
- **External:** Customers, payment gateway providers, hosting provider
